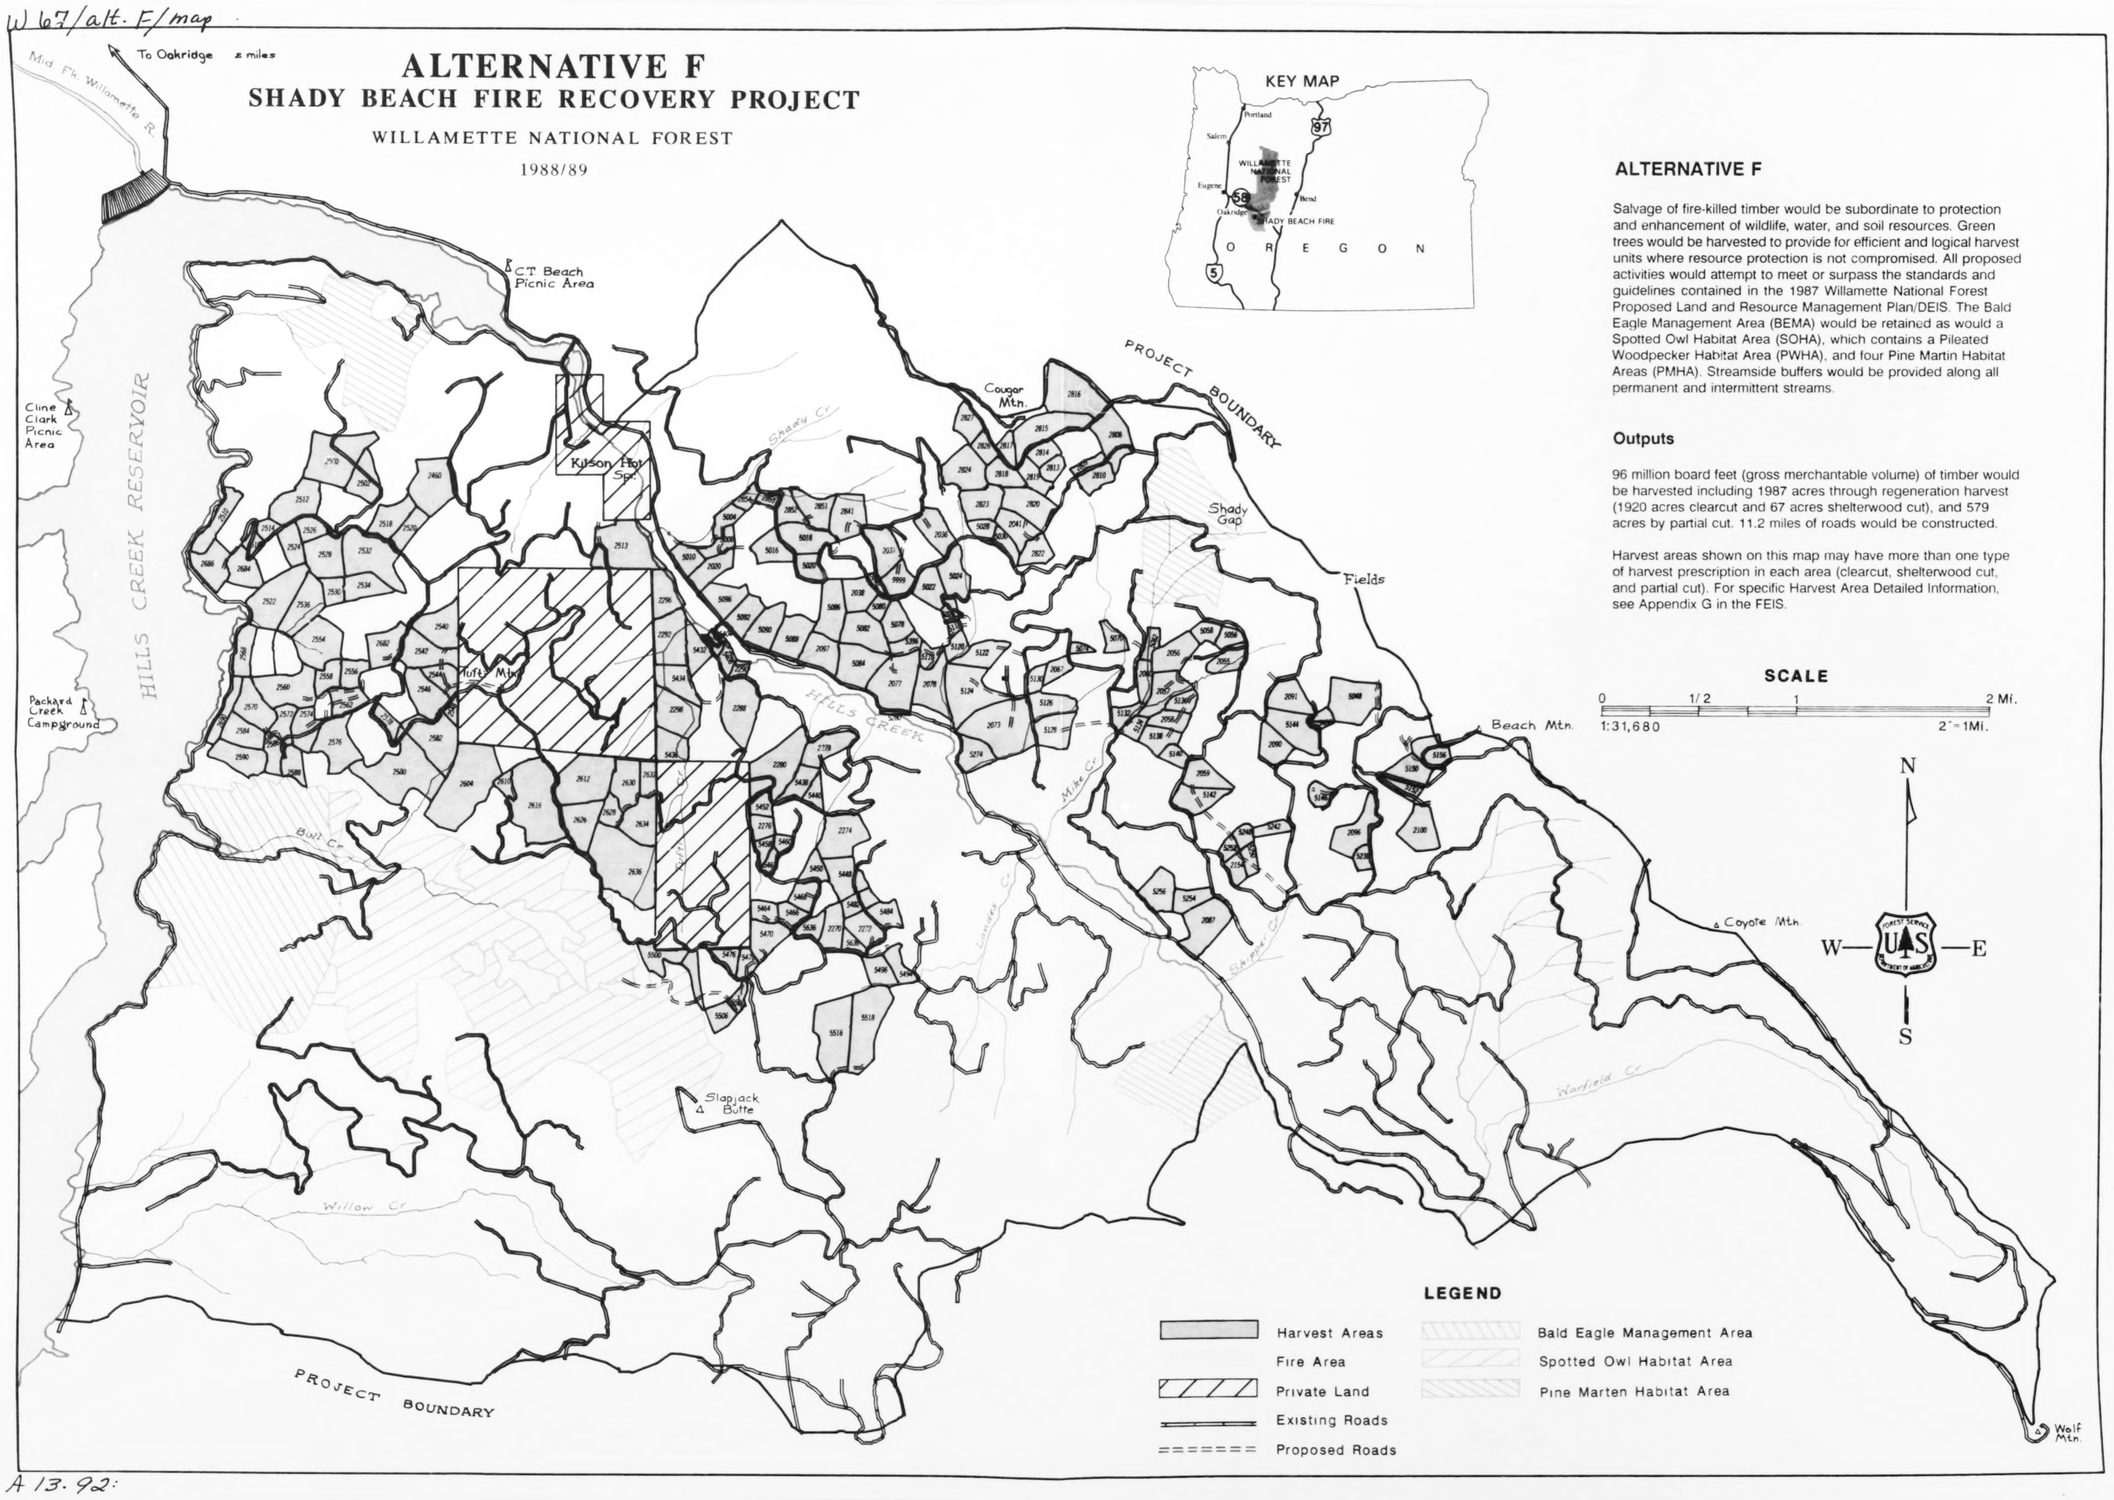
ALTERNATIVE F
SHADY BEACH FIRE RECOVERY PROJECT
WILLAMETTE NATIONAL FOREST
1988/89



KEY MAP

ALTERNATIVE F

Salvage of fire-killed timber would be subordinate to protection and enhancement of wildlife, water, and soil resources. Green trees would be harvested to provide for efficient and logical harvest units where resource protection is not compromised. All proposed activities would attempt to meet or surpass the standards and guidelines contained in the 1987 Willamette National Forest Proposed Land and Resource Management Plan/DEIS. The Bald Eagle Management Area (BEMA) would be retained as would a Spotted Owl Habitat Area (SOHA), which contains a Pileated Woodpecker Habitat Area (PWHA), and four Pine Martin Habitat Areas (PMHA). Streamside buffers would be provided along all permanent and intermittent streams.

Outputs

96 million board feet (gross merchantable volume) of timber would be harvested including 1987 acres through regeneration harvest (1920 acres clearcut and 67 acres shelterwood cut), and 579 acres by partial cut. 11.2 miles of roads would be constructed.

Harvest areas shown on this map may have more than one type of harvest prescription in each area (clearcut, shelterwood cut, and partial cut). For specific Harvest Area Detailed Information, see Appendix G in the FEIS.

SCALE

0 1/2 1 2 Mi.
1:31,680 2" = 1Mi.
